Increase Profits

Bio Shot™

Bio Shot is a highly concentrated combination of plant extracts designed to increase microbial populations and nutrient availability over a variety of crop production systems.

Bio Shot works at the extremely low rate of 1.5 oz per acre. This is because rather than supplying bulk nutrients, the extracts in Bio Shot work to accelerate growth inside the plant cell via cell signaling. The receptors on the plant cell receive the "message" that Bio Shot is sending and cause a cascade effect of positive responses inside the plant that result in more chlorophyll production, more carbohydrate and amino acid production, and more root exudation which will multiply and stabilize the population counts of soil borne microorganisms such as those found in Bio Seed. The microbial counts will then increase which will make macro and micro-nutrients available from conventional fertilizers and release nutrients from soil colloids and organic matter for plant uptake which might otherwise remain unavailable. This symbiotic feedback loop will make sure that the money spent on fertility products is being put to good use, and that the nutrient uptake by your crop is maximized throughout the growing season.

Bio Shot will tank mix with all conventional chemistries; and will work extremely well with liquid fertilizers for foliar, in-furrow, or fertigation applications.
